Document management In addition to storing drawings, CAD files can be used to describe the various aspects of a construction project in a structured manner. These documents include the building plans, technical details such as schematics, and the annotated construction drawings, which can include measurement and other information. In AutoCAD, construction drawings can be defined in many ways: Construction drawings are usually organized as engineering drawings of cross-sections, which includes dimensional drawings of the features that are part of the construction project. These may be scaled to a 1:1 or a 1:2 or 1:4 ratio. Construction drawings may include mechanical drawings of the structural elements. Construction drawings may include schematics or electrical schematics that are scaled to 1:1, which are usually used in a 1:1 layout. Design management Construction design is the application of an engineering design process to a construction project. The construction design process may be performed by a professional civil, mechanical, electrical, etc. design professional, or may be outsourced to a design company. In AutoCAD, the process of design management includes Plotting and establishing the project area and setting the boundary. Designing and creating geometric entities, including buildings and landscaping. Creating the architectural drawings. In AutoCAD, the design process also includes creating the configuration and construction management drawings. The drawings are usually organized into project schedules and sequence. Project management AutoCAD provides a variety of tools to control the progress and completion of a construction project. Categories of construction project management tools include: Project scheduling Project coordination Project management is an integrated process for managing multiple phases of a project. In construction, a construction project is generally split into multiple phases, for example, design, bidding, construction, and maintenance. In AutoCAD, construction projects are often defined using a graph of phases and associated activities. This graph is usually called the Schedule of Values (SOV). The AutoCAD project schedule is based on the "SOV Graph" template. Organizing and scheduling construction projects can be challenging

and manual methods are often tedious and error-prone. The SOV graph automates this process and helps manage the many design, bidding, construction, and maintenance activities. Review and approval The model used in construction management can be as simple as a lists of strings. More complex models can be built by defining a relationship. a1d647c40b
