What I want to know is if there is a way to replace the "custom" part of the url with a post slug. I want to replace the "123" in the example url with a slug of the actual post. Now I am using the permalink setting at A: Here is a function that adds permalink to only selected post To add this code to all your custom post type; Add this code to functions.php file of your theme (Let it your custom post type only) You are here Home » Guided Yoga Videos for Students Guided Yoga Videos for Students There is always interest in Yoga and all those 6a5afdab4c

Maxtor Maxboost Utility is a utility that was designed to make the performance of Maxtor hard disk drives (which have been produced by the company Maxtor until 2006) better. Its purpose was to avoid the fact that the data is currently stored in RAM before being written on a hard drive, which has an inefficiency effect on speed, but also on power consumption. The application resolves this issue by "caching" the data being read or written, a practice that makes the storage process faster. This utility is addressed to users that own Maxtor hard drives, (ideally the ones that have been produced in the past, but as long as there are those that still support it, this wouldn't be an issue). If you only own one Maxtor hard drive, there's a chance you can use this utility to get its performance higher. Maxtor Maxboost Utility is an oldie, so to say. Its days of glory are over since it addresses hard drives that are no longer produced, although the technology issued by Maxtor may still be present in some computers. Maxtor Maxboost utility

Any help you can render is greatly appreciated!Q: How to check whether an assembly is applied to a given webapplication? I'm building a web application which uses a library (say "library.dll") that wasn't deployed to the server. Is there any way to check whether the assembly is actually deployed to the server and working? I'm looking for something similar to this answer but for the whole webapp, not only the executing.exe file. For example, if I hit my webapp from the server, then it works, otherwise, it doesn't. So I'm interested to know, if it is possible to check this at runtime. A: I figured out a solution. Save a file containing the name of the dll you are interested in. Run that assembly with Assembly.LoadFrom Check if System.IO.File.Exists("path to the file in step 2") It doesn't look perfect, but so far it's the only solution I've found. Hip-hop fans gather to show their support for Canadian rapper Drake at his surprise show in Johannesburg A surprise show by Canadian rapper Drake to celebrate
