Getting familiar with the workspace Photoshop works on a workspace with two panes, one on the left side and one on the right side. The right-side canvas is the one in which you make your edits. The left-hand canvas contains elements of a toolbox (those little red, white, or orange folders that appear on its bottom-left corner), as well as items on the workspace that are not tools or text. The following list describes the elements and functions on the workspace:

- Layer panel:** A panel at the bottom of the workspace that shows you the different layers and their properties.
- Layers palette:** The window at the top of the workspace with layers and options for modifying the layers. Note that the layers palette shows only the visible layers. To hide a layer, click its thumbnail to hide it. To make a layer visible again, double-click its thumbnail or click its name in the Layers palette. The Layers palette can also be accessed by right-clicking a layer in the Layers panel and selecting Layers from the context menu. You can also use the keyboard shortcut of Ctrl+1 (for the first layer) or Shift+Ctrl+1 (for all layers except the active layer).
- Toolbox:** The panel at the bottom of the workspace with tools and text boxes that you can open. You can move these elements anywhere on the workspace. The workspace holds everything you need to edit an image, so you don't have to continually move to other tools that aren't directly related to editing. The tools and the workspace are separated to provide a clean, organized

Flow cytometric assessment of the cell cycle kinetics and DNA synthesis of human normal and tumoral lymphocytes. The cell cycle distribution and DNA synthesis of human peripheral blood lymphocytes (PBL) obtained from 18 patients with a variety of solid neoplasms and 6 patients with lymphoma were studied by flow cytometry. The distribution of cells in the S phase of the cell cycle and their proliferative capacity were also analyzed. Lymphocytes of patients with lymphoma revealed a statistically significant higher proportion of cells in the S phase and a lower proliferative capacity when compared with those of normal and disease-free patients (P less than 0.01, P less than 0.001, respectively). The values of PBL from patients with various neoplasms did not differ significantly from the values of lymphocytes from normal controls./\* SNMP interface for Deos device management agent Copyright (C) 2004-2007 Richard Purdie All rights reserved.
