2D drawing A traditional 2D drawing, also referred to as a linear drawing, is a graphical representation of a set of objects or entities. These entities are formed in the drawing by means of two types of objects: lines, and shapes. Lines are drawn between any two points on a geometric body. The simplest shape is a line segment, the line end points being the points that form the end of the segment. A line segment is closed if there is a point on it that is the same as its own start point. The line formed between two points is commonly referred to as a "line". Other simple shapes include circles, polygons, and arcs. Such objects are often represented as a sequence of lines. The drawing has two coordinate systems, a planar coordinate system and a user coordinate system. In a traditional 2D drawing, the planar coordinate system is used to represent two-dimensional space and the user coordinate system is used to represent the orientation of the objects. Objects are located at points and, through a set of transformations, are oriented. A drawing is a set of objects and the relations between these objects. In order to create a 2D drawing, the designer must define, describe and place each of the entities. In addition, the designer must be able to specify the constraints that bind these entities together. For example, the objects may not move or rotate, or they may be required to overlap one another. The designer must also be able to specify the appropriate display properties of the objects. A 2D drawing has a fixed number of objects; as such, it is not possible to delete or extend the drawing. In traditional 2D drawing, there are two types of lines: segments and linetypes. Segments are lines that connect two points. Line types are classified according to their appearance (e.g. dotted line or dashed line). A new drawing feature is Inline drawing. This makes it possible to create diagrams in a separate file and include these in other drawings. In this way, they can be inserted into the drawing without having to re-create them. 3D drawing A 3D drawing is similar to 2D drawing, except that it represents the three-dimensional space. A 3D drawing can be created using two types of entities: faces and edges. A face is formed by connecting edges together. The three-dimensional nature of 3D objects means that they can be oriented in space by specifying a direction vector and aId647c40b
